

SSE (UI)

Front-end Tech: ReactJS/ Angular

Problem Statement: You are building a job portal where people can view/ post contract jobs to be performed. There are two sections to this portal: Freelancer, Employer. Build the following as part of your craft demo.

Login Page with different employer/ freelancer sections.

FreeLancer Section:

User Profile:

- User should be able to select skills matching to his profile.
- Should be able to add his Git profile, and list his projects. Check <https://api.github.com/users/{public-username}/repos>
- Basic Form Validations

Job Listing Page:

- Should be able to see all posted jobs.(Prepare mock data for at least 10K postings, check <https://www.generatedata.com/> or similar websites)
- Should be able to filter by skill set/ min. salary per hour.
- Quick-Apply to a job with a single click.

Employer section:

Allowing new jobs to be posted that:

- Displays a form collecting the following data points:
 - Job description document with maximum length of 16KB.
 - Job requirements.
 - Tags relevant to the job.
 - Company Name and contact info of the job poster.
- View his jobs posted.
- Displays the number of applications on that job.
- Ability to see the user profile of the job applicant.

Stretch goals (Out-of-the-box solutions not to be used for this section):

1. Responsive design.
2. Dark mode theming
